

### Selection Sort (swap)

$i = 0; j = i+1$   
 $0 \ 2 \ 4 \ 5 \ 8$   
 $0 \ 1 \ 2 \ 3 \ 4 \rightarrow n-1$

\* At each index we need to place the minimum value.

$i = 0; j = i+1 \text{ to } (n-1)$   
 $\text{minIndex} = i; \times 0$   
 $\text{minIndex} = j \quad 4$   
 $\text{Swap}(\text{arr}[i] \ \& \ \text{arr}[\text{minIndex}])$

$f(\text{iterations}) \ O(n^2)$   
 swap                  shift

### Insertion Sort (shift)

$i = 0; j = i+1$   
 $\text{arr}[j] < \text{arr}[i]$

temp = 4

(-1)  $\text{arr}[i+1] = \text{arr}[i]$   
 $i = 1$   
 $j = i - 1$   
 $\text{for}(i = 1; i < \text{arr.len}; i++) \{$

### Count Sort → Non-Comparison Algo → $O(n + \text{max})$

① Single Digit Whole Numbers (0-9)

Step: → 1 Find the max  $\text{arr} = [3, 4, 6, 1, 4, 3, 2, 3, 1]$   
 $\text{max} = 6$

Step: → 2 Create a count array with index 0-max

Step: → 3 Calculate the frequency of each element

Step: → 4 Calculate cumulative count

Step: → 5 Start from the end ( $R \rightarrow L$ )

### Radix Sort → Bucket Sort

\* Multi-digit Nos  
 \* Constant length strings

\* Non-comparison algo

① Find the max: 437  
 3 digits ∴ 3 passes

② Create 0-9 10 buckets

$O(n + \text{max})$

How do we control the no. of passes in the Radix Sort algo?  $\text{max} = 437 = 3$

$\Rightarrow \text{for}(\text{int exp} = 1; \text{max}/\text{exp} > 0; \text{exp} *= 10)$   
 $\{$   
countSort(arr, size, exp);  
 $\}$

$437/1000 = 0$   
 $437/100 = 4$   
 $437/10 = 43$   
 $437/1 = 437$
